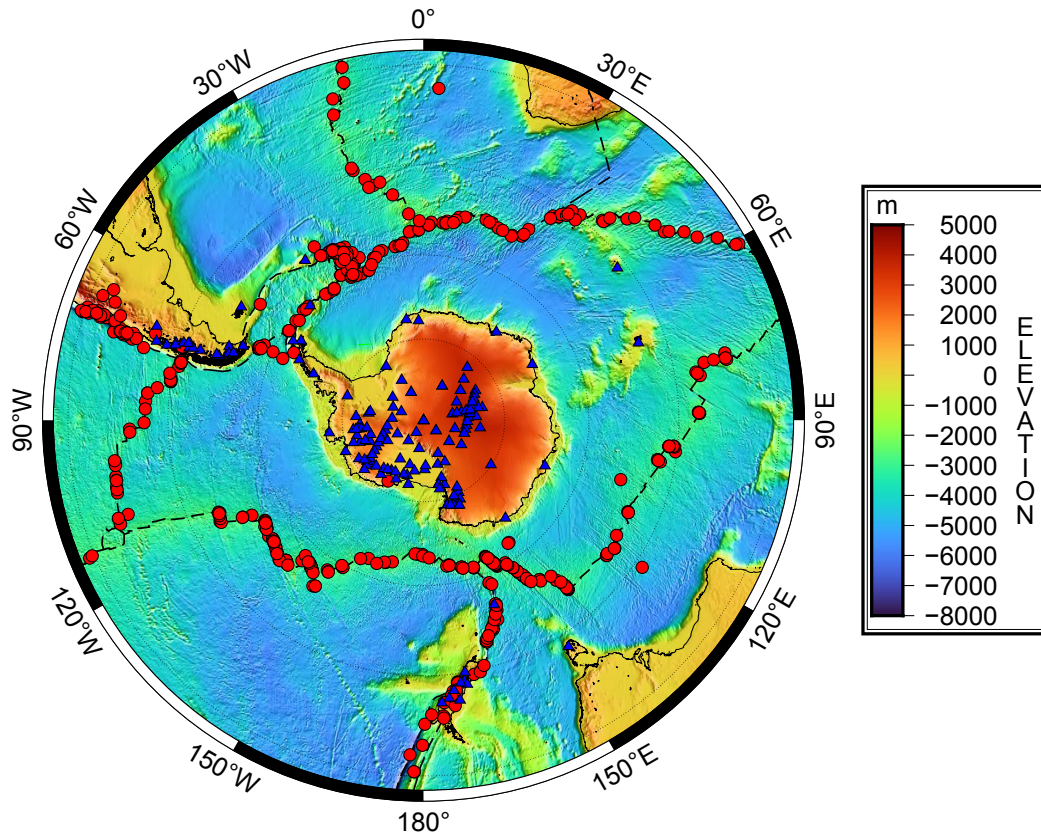

Figure S1: Maps of the selected event location (red circles) and stations (blue triangles) superimposed on bathymetry and topography Tozer et al. (2019). Ocean ridges are shown by the dashed black lines.

Reference:

Tozer, B. and Sandwell, D.T. and Smith, Walter H.F. and Olson, C. and Beale, J.R. and Wessel, P., (2019) “Global bathymetry and topography at 15 arc sec: SRTM15+”, *Earth Space Sci.*, 6(10), 1847–1864, doi: 10.1029/2019EA000658

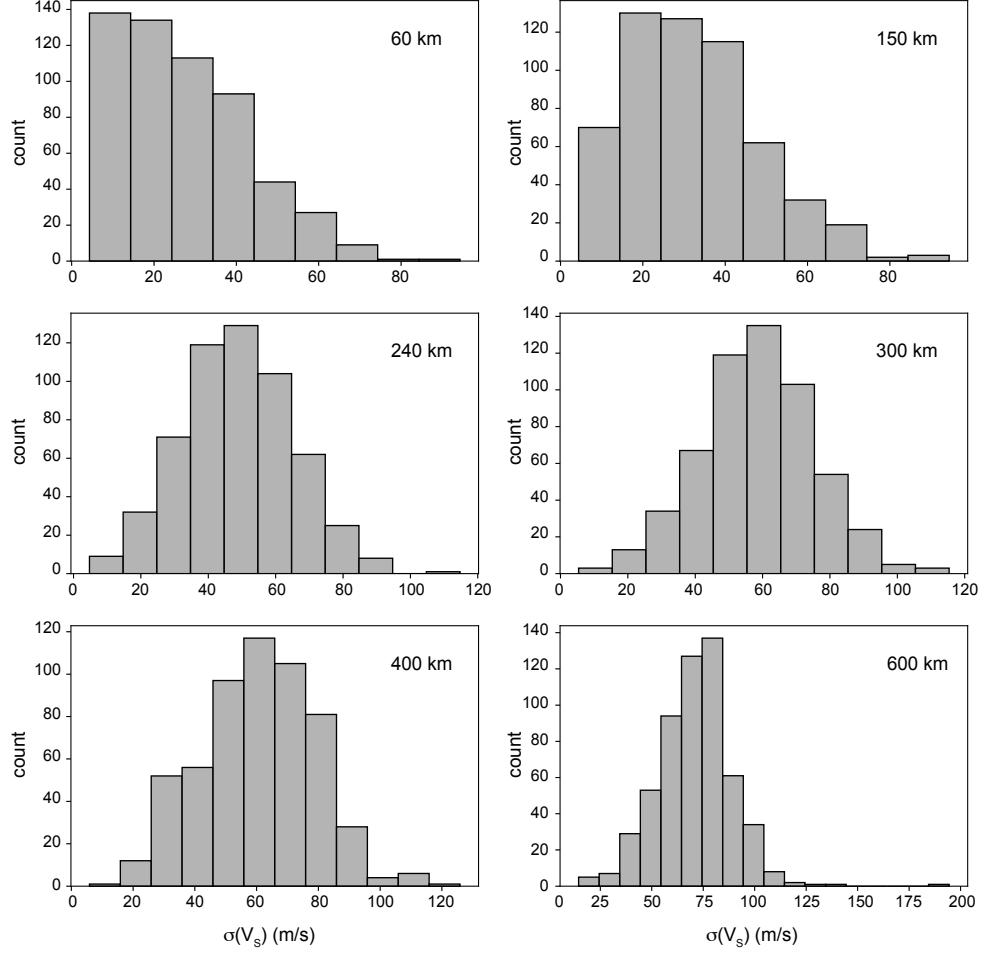

Figure S2: Distribution of path-averaged velocity $V_{SV}(z)$ standard deviations at different depths. All paths shown in Fig. 2 of the main text were included, and the standard deviation for each path is calculated from the ensemble of models obtained by our MCMC algorithm.

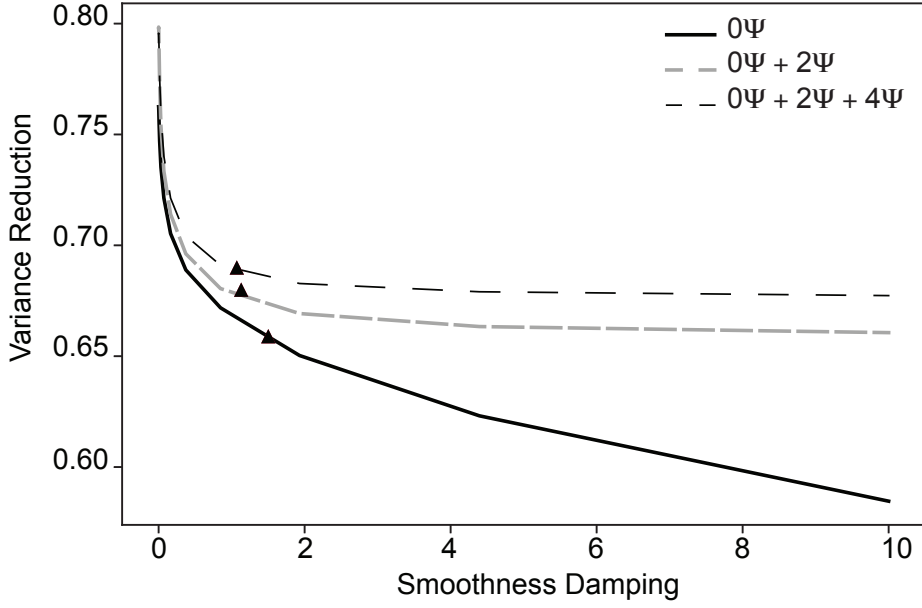

Figure S3: Example of damping parameter selection based on the L-curve method. The optimal damping parameters are selected at the elbow of the curves and are denoted by triangles. We first searched for the damping parameters for the 0Ψ -term. The $0\Psi + 2\Psi$ curve was obtained by fixing the selected isotropic damping parameter and changing the 2Ψ -term damping. The $0\Psi + 2\Psi + 4\Psi$ curve resulted from varying the 4Ψ damping parameter while fixing the isotropic and 2Ψ -term damping parameters.

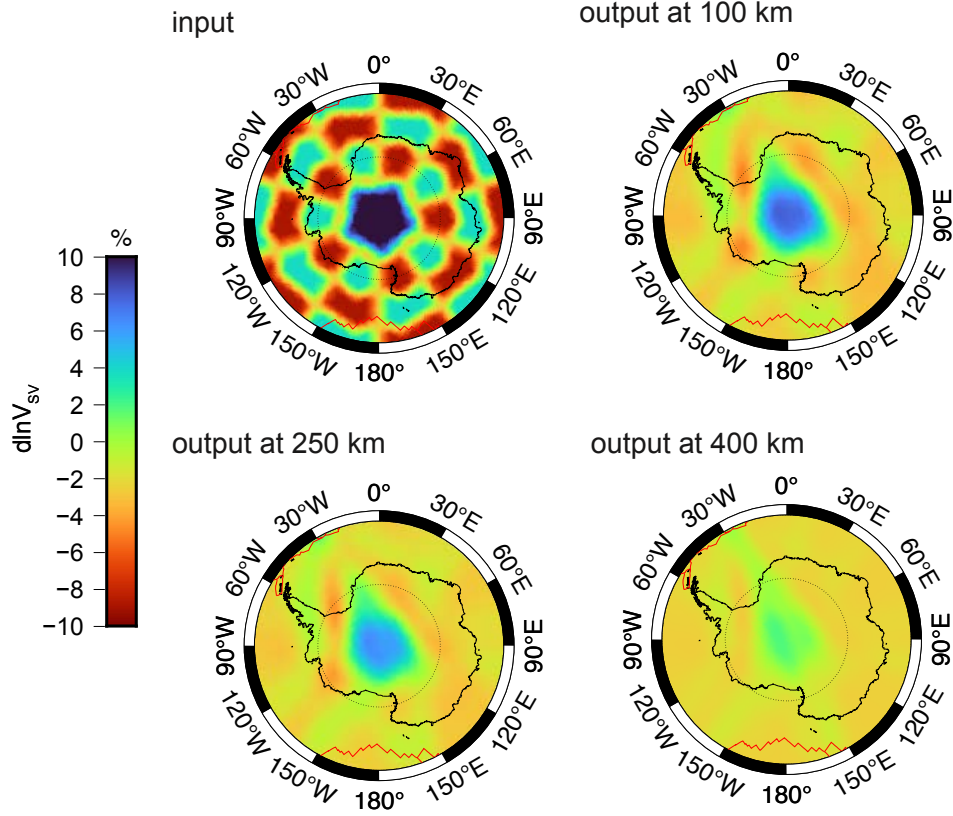

Figure S4: Synthetic tests with isotropic checkerboard input model and the corresponding isotropic output models at 100 km, 250 km depth, and 400 km. The input cells span 30 degrees in longitude and 8 degrees in latitude. The anomaly at the pole has a radius of 8 degree.
